
Low temperature sparkle powder (10 grams.)

Traditional sparkle powder is made from heavy metal, so it would produce extreme heat around 1000 ? after burning.

But, "*Low Temp. Sparkle Powder*" launched by Cigmamagic gives off less heat than flash paper does while burning, which make it safer for using.

More importantly, there would be no smoke or ashes remained after burning, but only pure sparkle.

"Low Temp. Sparkle Powder" should be used with flash paper or flash cotton, which you may get from extra purchases.

Note: This product contains 10g "Low Temp. Sparkle Powder".
