

Ultra Prediction Table by Pitata

Using a concealed printer for predictions is no longer something novel in Magic. It's actually the perfect tool for it, capable of presenting any prediction effortlessly. However, most predictions that use this method currently rely on small thermal printers, capable of printing strips of thermal paper with a maximum width of 8mm, making them better for close-up magic, smaller venues, or television performances.

There aren't many options available for larger Open Predictions on stage utilizing this method, especially for more elaborate predictions, presenting multiple information clearly on a large sheet of paper. It is a significant challenge to develop such a device that is just right, requiring considerations not only for the printer's size and realistic printouts but also for designing a completely new, entirely unsuspecting way of presenting the prediction on paper, as well as the overall appearance of the props on stage.

After two years of struggle, we've explored all printer technology options on the market and selected one best suited for presenting such an illusion and designed and developed the **Pitata Ultra Prediction Table**, along with its supporting structure and a brand-new paper clamping system to keep the prediction secure.

The Perfect Prediction for the Stage

A folder is displayed on a table. The audience is invited to go on an imaginary journey and provide their fabricated information for your story. There's only one piece of paper inside - your prediction matches exactly what the audience picked.

The **Pitata Ultra Prediction Table** not only predicts a single piece of content but also performs predictions containing multiple pieces of information.

Realistic Writing

After researching all printer technologies on the market, we picked a special printer that makes the predictions look like they were written with crayons or pencils. The result differs from ordinary inkjet or toner, resembling the realistic texture of crayon or thick pencil writing, which we believe is best suited for presenting such stage predictions.

Table That Can Be Disassembled

To conceal the printer while making the entire appearance look unsuspecting, we designed a table and stand that can be easily assembled and broken down. The printer is placed inside the tabletop, and through clever structural design, the table appears very thin even when viewed from the sides.

Unique Folder Loading System

The prediction is fed directly into the folder through a gap in the tabletop. When the magician picks up the folder, with just one swift action, the paper is clamped inside the folder, making it appear as if it were there from the very beginning.

Features:

- Organic combination of modern technology and traditional methods.
- Perfect predictions for the stage.
- Printing that looks almost like real writing.
- Unique folder loading system.
- Table base that can be disassembled.
- The Pitata Ultra Prediction Table refill uses regular A4 size printer paper.

Dimensions:

- Assembled table: Top 450mm x 320mm, Height 835mm
- Gimmicked folder: 320mm x 240mm
- Weight: 8 KG (without aviation case)
- Aviation case: 2 KG
